

Team15

Bee Protecting Mobility (BPM)

Introducing an autonomous car that protects bees from hornets.

It detects hornets in real-time and sends notifications to beekeepers.

PART 03.

Design Part

It is a part that introduces the part designed by our team in vehicle development.

Functional Definition

Func1 : Self-Driving Car

It is a self-driving vehicle using Raspberry Pi that moves around the Beekeeping to watch over the area in front of the beehives.

Func2 : Bees & Hornets Distinguished AI

It analyzes video using OpenCV and uses YOLO to distinguish between honeybees and hornets.

&

Func3 : UI using the website

The beekeeper can easily monitor the area around the beehives in real-time through the website.

Development

Process

Self-Drive

We used a Raspberry Pi board. The car was designed to move using line tracing, stop at designated points, and then resume. It was challenging because we wasn't familiar with the board.

#RaspberryPi #Line-Tracing

Data Labeling

Getting good data was the most important task. To improve hornet recognition, we labeled the hornet's head, chest, and abdomen separately for training.

#Data Labeling #Find Data

Difficulties

There were difficulties in transmitting the video captured by the camera to the server. In the process of recognizing hornets, external factors often interfered with recognition. For example, lighting conditions, the speed of the hornet, and the angle all had an impact.

#Network-Conn #Hornet recognizing

TEAM 15. SKFF

THANK YOU FOR LISTENING

This has been TEAM 15.
Thank you for listening to the presentation.
